Adjuvant atezolizumab after adjuvant chemotherapy in resected stage IB–IIIA non-small-cell lung cancer (IMpower010): a randomised, multicentre, open-label, phase 3 trial

Lancet 2021; 398: 1344–57

Stage IB-IIIA NSCLC
N=1005

Inclusion Criteria

- ≥ 18 y/o
- Eastern Cooperative Oncology Group (ECOG) performance status 0 or 1
- Completely resected stage IB to IIIA NSCLC, and were able to receive cisplatin-based chemotherapy

Atezolizumab 1200mg IV
N=507

1:1

Best supportive care
N=498

Baseline characteristics

	PD-L1 TC ≥1% stage II–IIIA group (SP263)		All stage II–IIIA group		Intention-to-treat group (stage IB–IIIA)

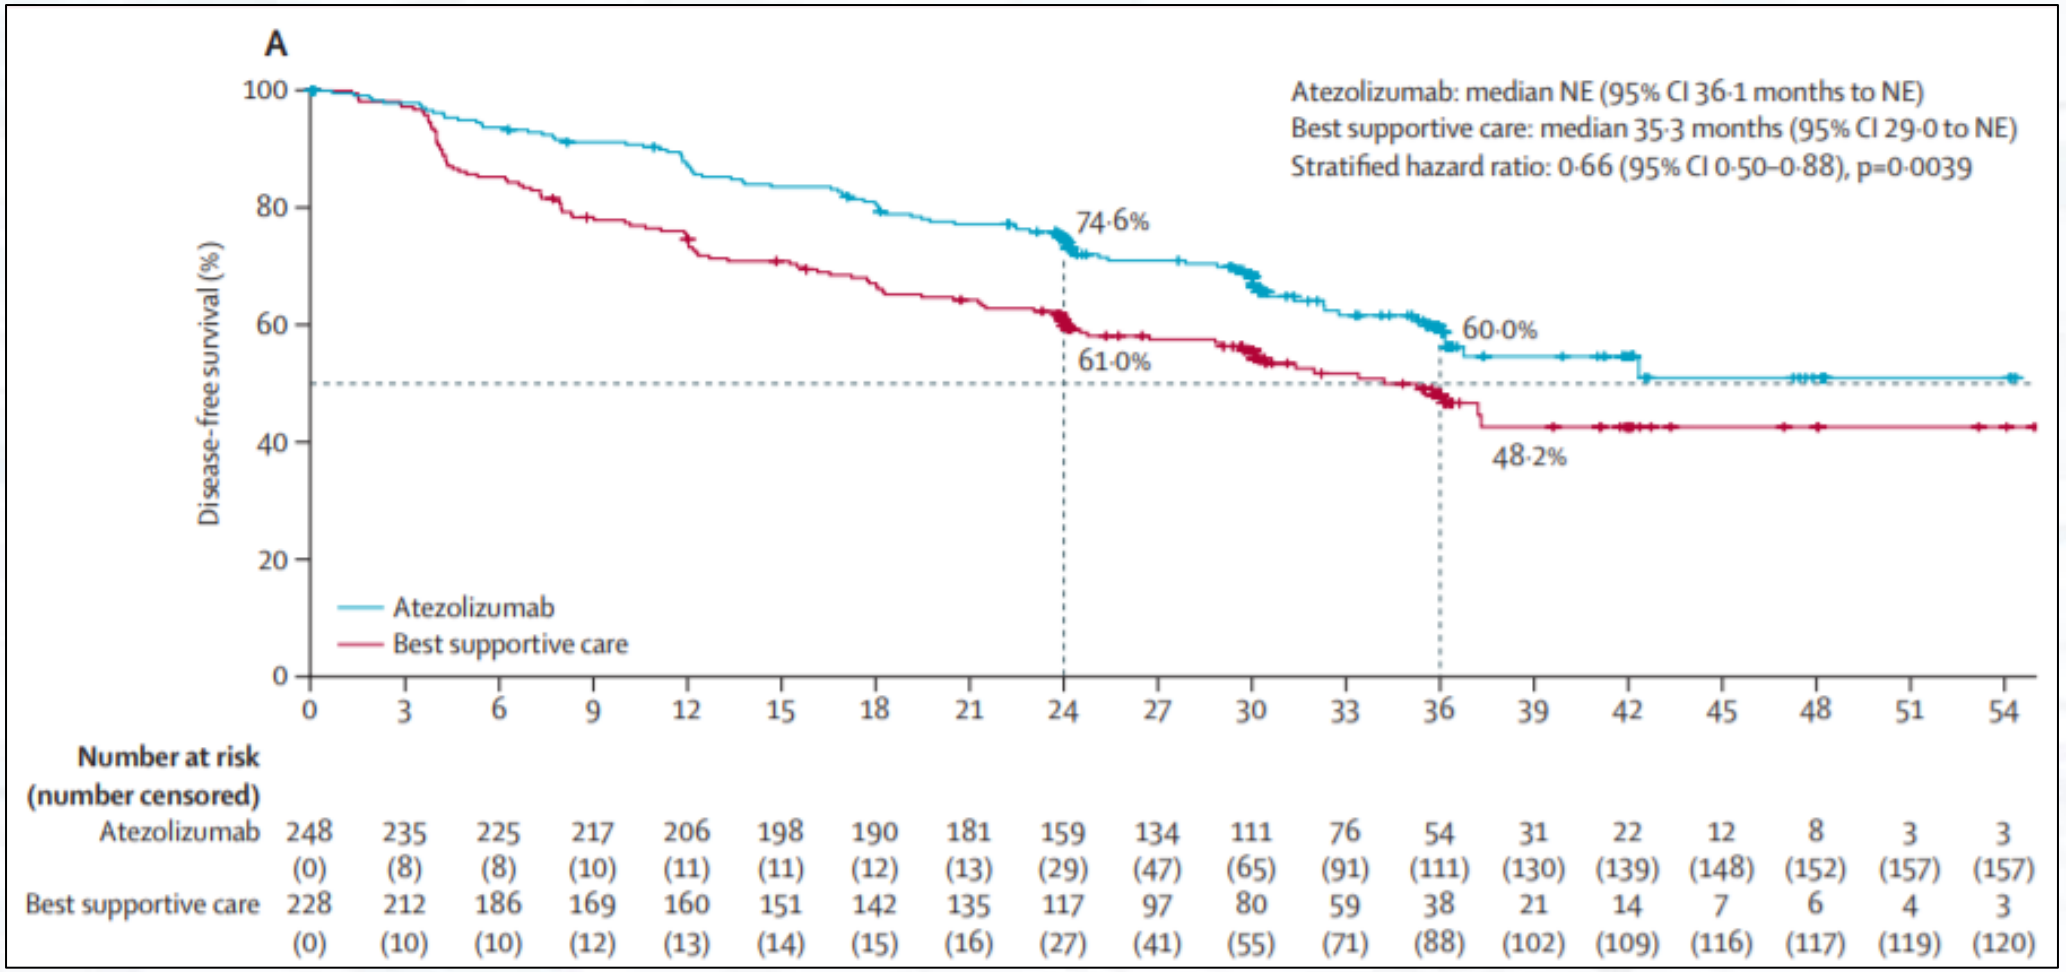
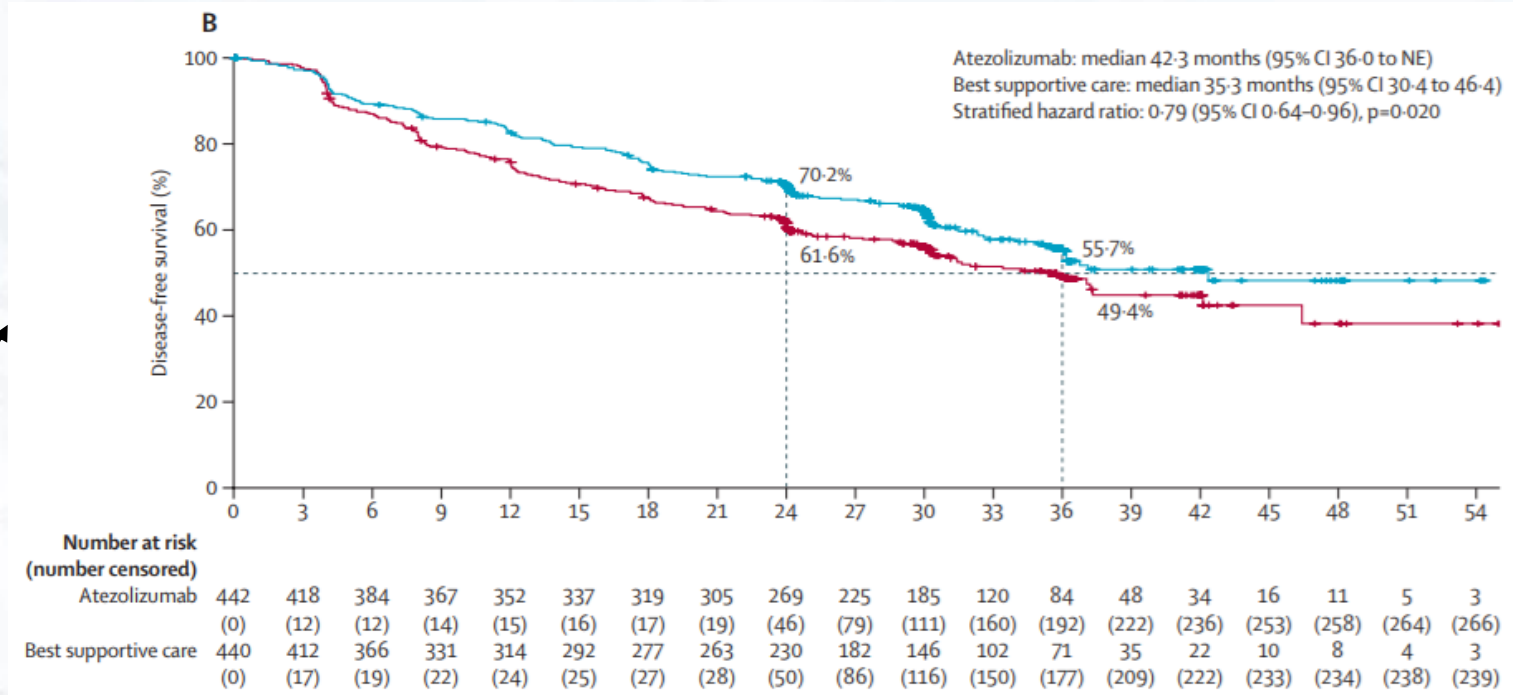
Outcomes-
PD-L1 TC ≥1% stage II–IIIA group



Outcomes

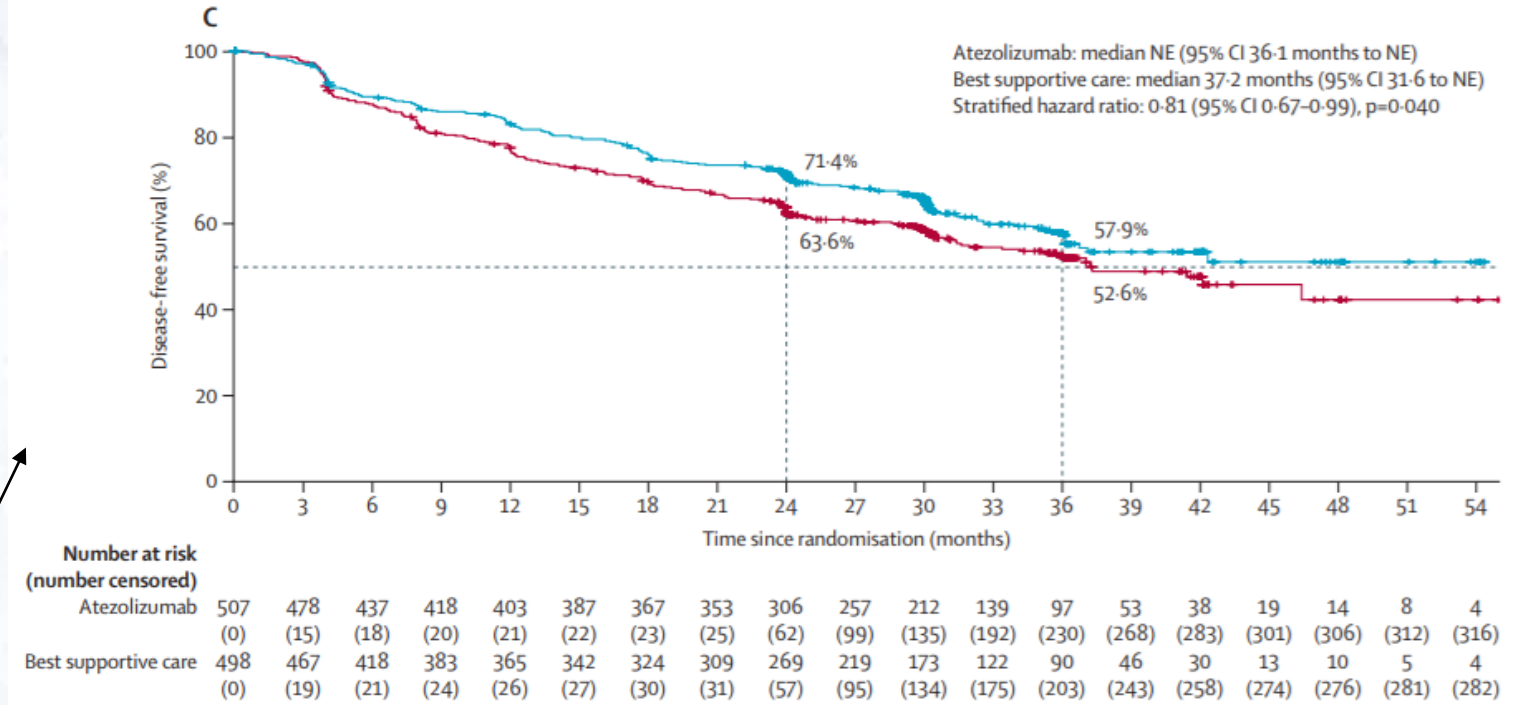
36-month disease-free survival :
Atezolizumab group: 55.7%
Placebo group: 49.4%

All stage II–IIIA group

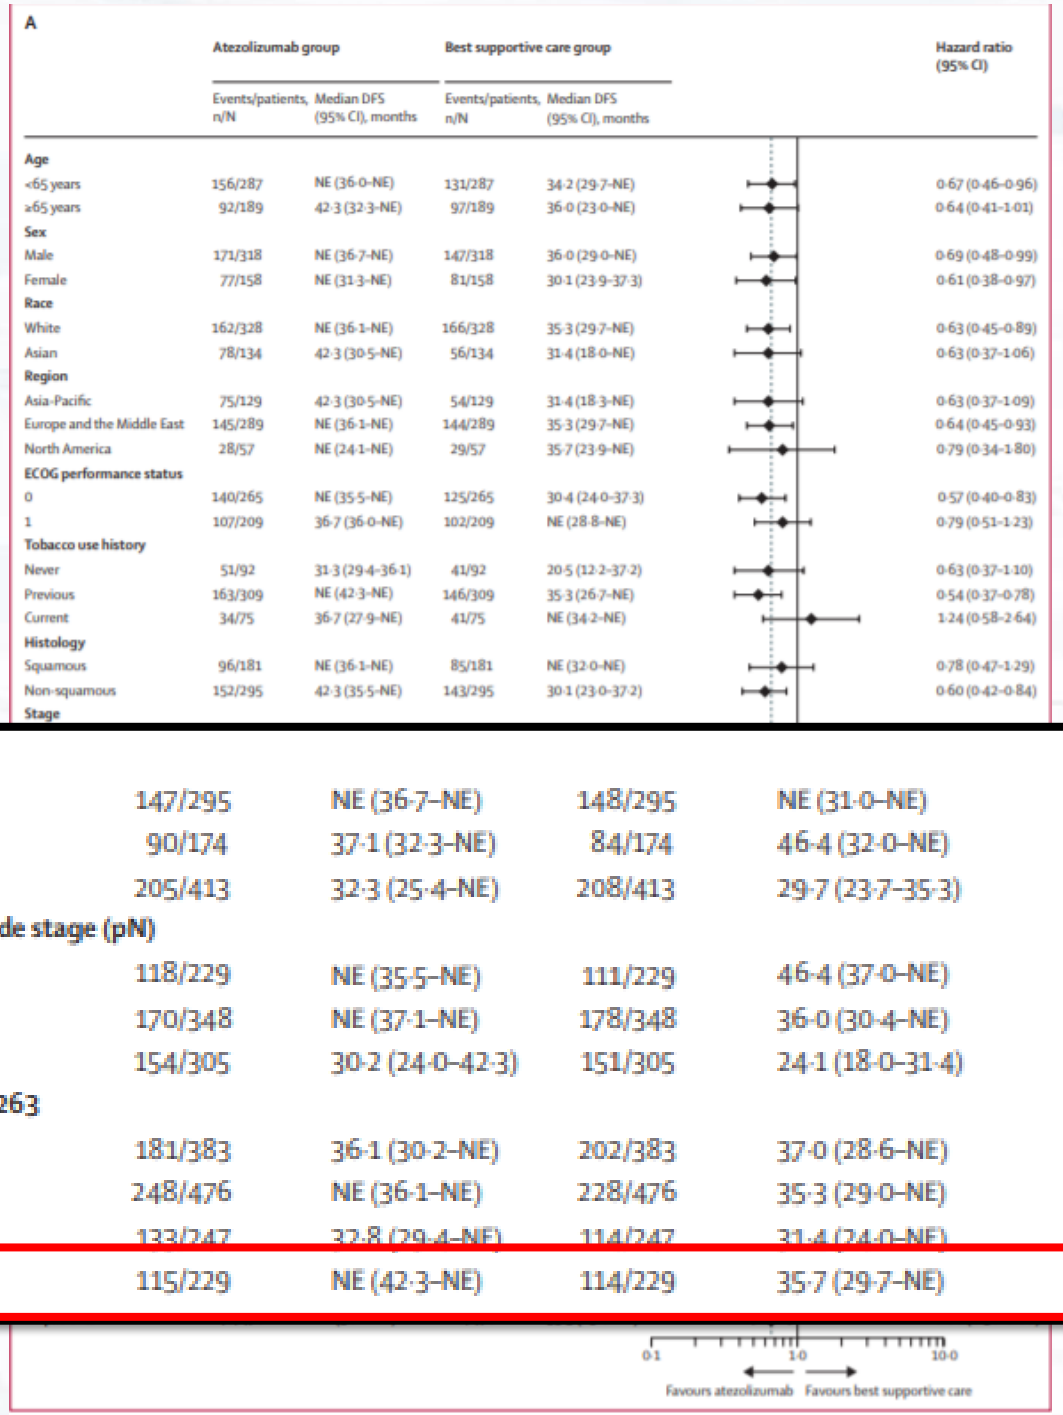


36-month disease-free survival :
Atezolizumab group: 57.9%
Placebo group: 52.6%

Intention-to-treat group



Subgroup Anaiysis



Adverse event

	Atezolizumab group (n=495)			Best supportive care group (n=495)		
	All grades	Grade 3–4	Grade 5	All grades	Grade 3–4	Grade 5
Any cause	459 (93%)	108 (22%)	8 (2%)†	350 (71%)	57 (12%)	3 (1%)‡
Cough	66 (13%)	0	0	46 (9%)	0	0
Pyrexia	65 (13%)	4 (1%)	0	11 (2%)	1 (<1%)	0
Hypothyroidism	55 (11%)	0	0	3 (1%)	0	0
Alanine aminotransferase increased	53 (11%)	8 (2%)	0	16 (3%)	1 (<1%)	0
Aspartate aminotransferase increased	53 (11%)	7 (1%)	0	16 (3%)	0	0
Arthralgia	52 (11%)	2 (<1%)	0	26 (5%)	0	0
Pruritus	51 (10%)	0	0	3 (1%)	0	0
Nasopharyngitis	33 (7%)	0	0	50 (10%)	0	0

Data are n (%). *Includes all-grade adverse events occurring in 10% or more of patients in either group, along with corresponding frequencies for grade 3–4 and grade 5 events. †Interstitial lung disease, multiple organ dysfunction syndrome, myocarditis, and acute myeloid leukaemia (all four events related to atezolizumab), and pneumothorax, cerebrovascular accident, arrhythmia, and acute cardiac failure. ‡Pneumonia; pulmonary embolism; and cardiac tamponade and septic shock in the same patient.

Table 3:* Most commonly reported adverse events in the atezolizumab or best supportive care groups

Conclusion

- Adjuvant atezolizumab shows a disease-free survival benefit in the stage II–IIIA population with PD-L1 TC ≥1% and in all patients in the stage II–IIIA population.

limitation

- Open-label design

Tofacitinib in juvenile idiopathic arthritis: a double-blind, placebo-controlled, withdrawal phase 3 randomised trial

Lancet 2021; 398: 1984–96

Inclusion Criteria

- aged 2-18 years
- Polyarticular course JIA

Exclusion Criteria

- systemic JIA with active systemic features other than active joints
- elevated acute-phase reactants within 6 months of enrolment
- persistent oligoarthritic
- undifferentiated JIA
- active uveitis within 3 months of enrolment

Table 3: **Summary of laboratory values in patients with polyarticular course JIA, psoriatic arthritis, or enthesitis-related arthritis**

Conclusion

- Tofacitinib is an effective treatment in patients with polyarticular course JIA

limitation

- Population was relatively small and predominantly White
- The follow-up length of this trial in patients with JIA was too short to assess long-term safety

Safety and immunogenicity of concomitant administration of COVID-19 vaccines (ChAdOx1 or BNT162b2) with seasonal influenza vaccines in adults in the UK (ComFluCOV): a multicentre, randomised, controlled, phase 4 trial

Lancet 2021; 398: 2277

Inclusion Criteria

- ≥ 18
- Had

接種注意事項

1. **發燒或正患有急性中重度疾病者，宜待病情穩定後再接種。**
2. 本疫苗不得與其他廠牌交替使用。若不慎使用了兩劑不同COVID-19疫苗產品時，不建議再接種任何一種產品。
3. 目前尚無資料顯示與其他疫苗同時接種對免疫原性與安全性的影響。**COVID-19 疫苗與其他疫苗的接種間隔，建議間隔至少7天**。如小於上述間隔，則各該疫苗亦無需再補種。
4. 免疫功能低下者，包括接受免疫抑制劑治療的人，對疫苗的免疫反應可能減弱。(尚無免疫低下者或正在接受免疫抑制治療者的數據)
5. 目前沒有足夠數據建議孕婦可常規接種COVID-19疫苗，惟若為高感染風險可能因罹患COVID-19導致嚴重併發症的情形，可經醫師評估是否接種疫苗。
6. 若哺乳中的婦女為建議接種之風險對象(如醫事人員)，應完成接種。目前對哺乳中的婦女接種COVID-19疫苗的安全性、疫苗對母乳或受哺嬰兒之影響尚未完全得到評估，但一般認為並不會造成相關風險。接種COVID-19疫苗後，仍可持續哺乳。

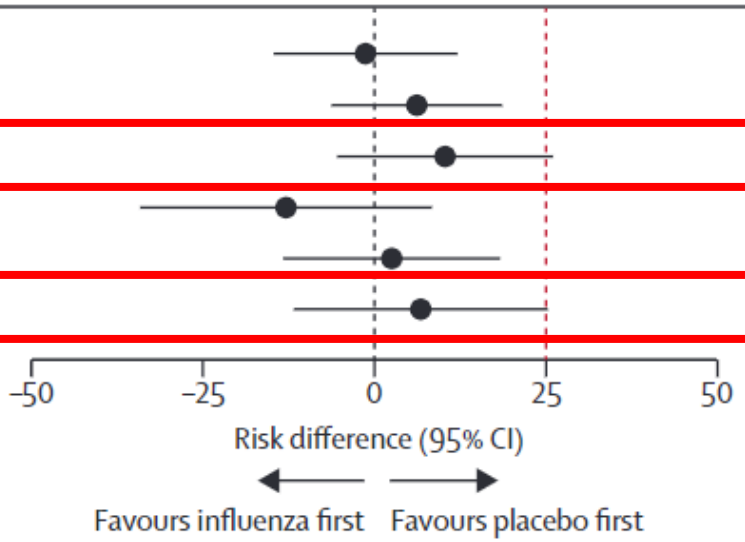
Data are median (IQR) or n (%). Placebo first indicates that COVID-19 vaccine alone was received at day 0. Flu first indicates that concomitant COVID-19 and influenza vaccines were received at day 0.

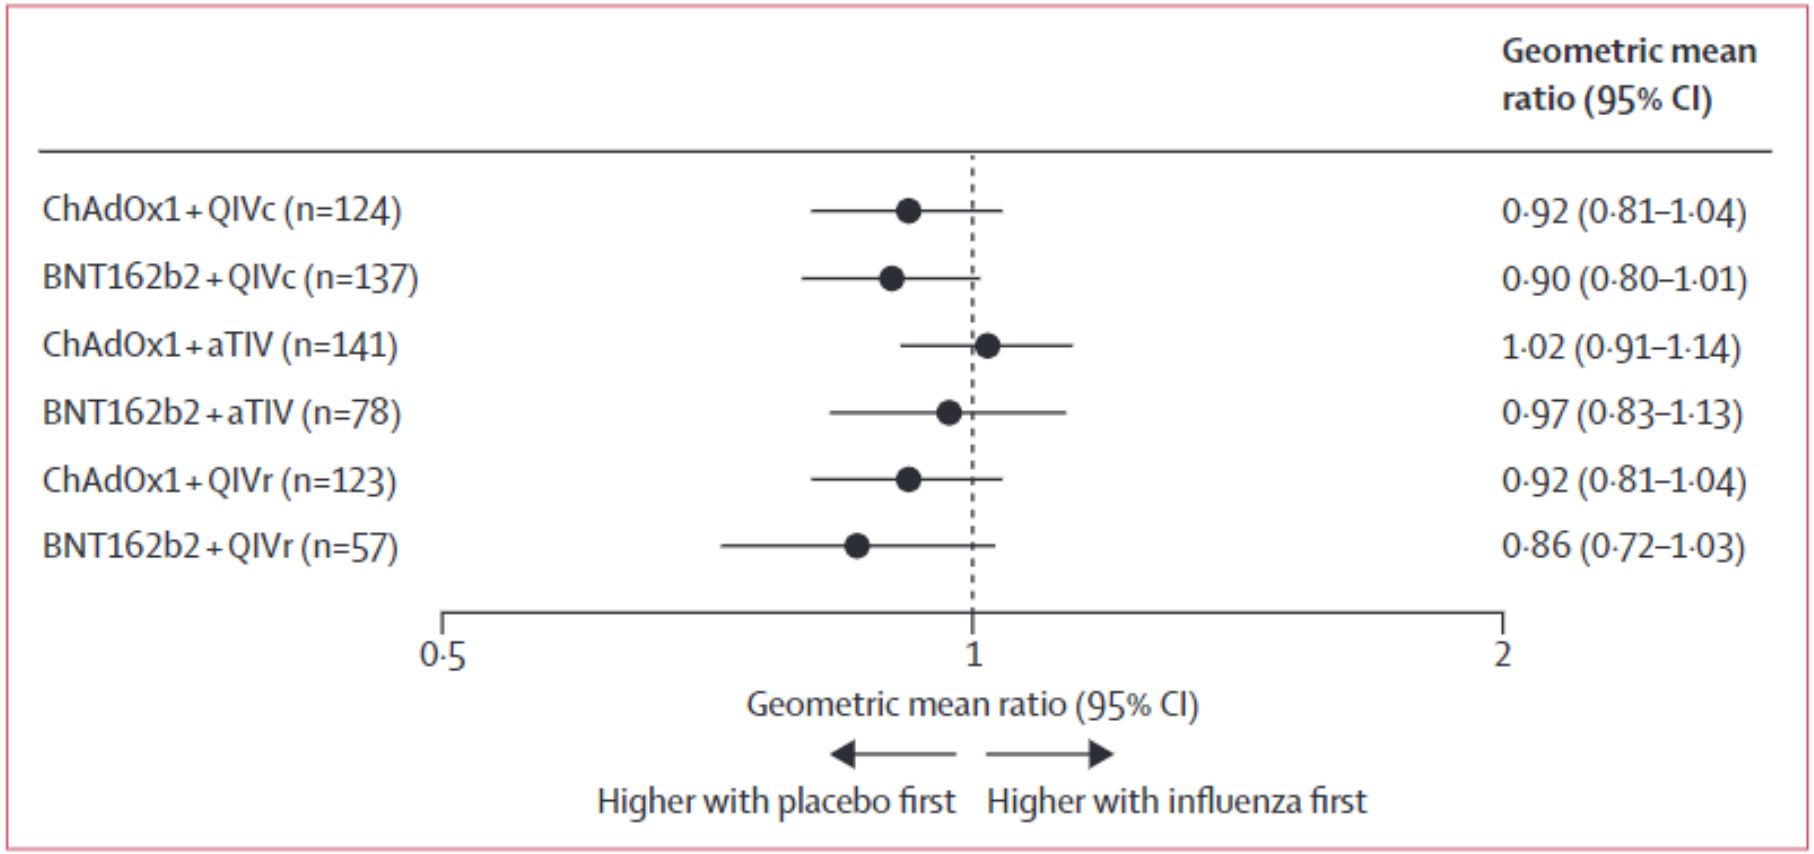
Table: **Participant demographics**

Primary Outcome- Systemic adverse reactions

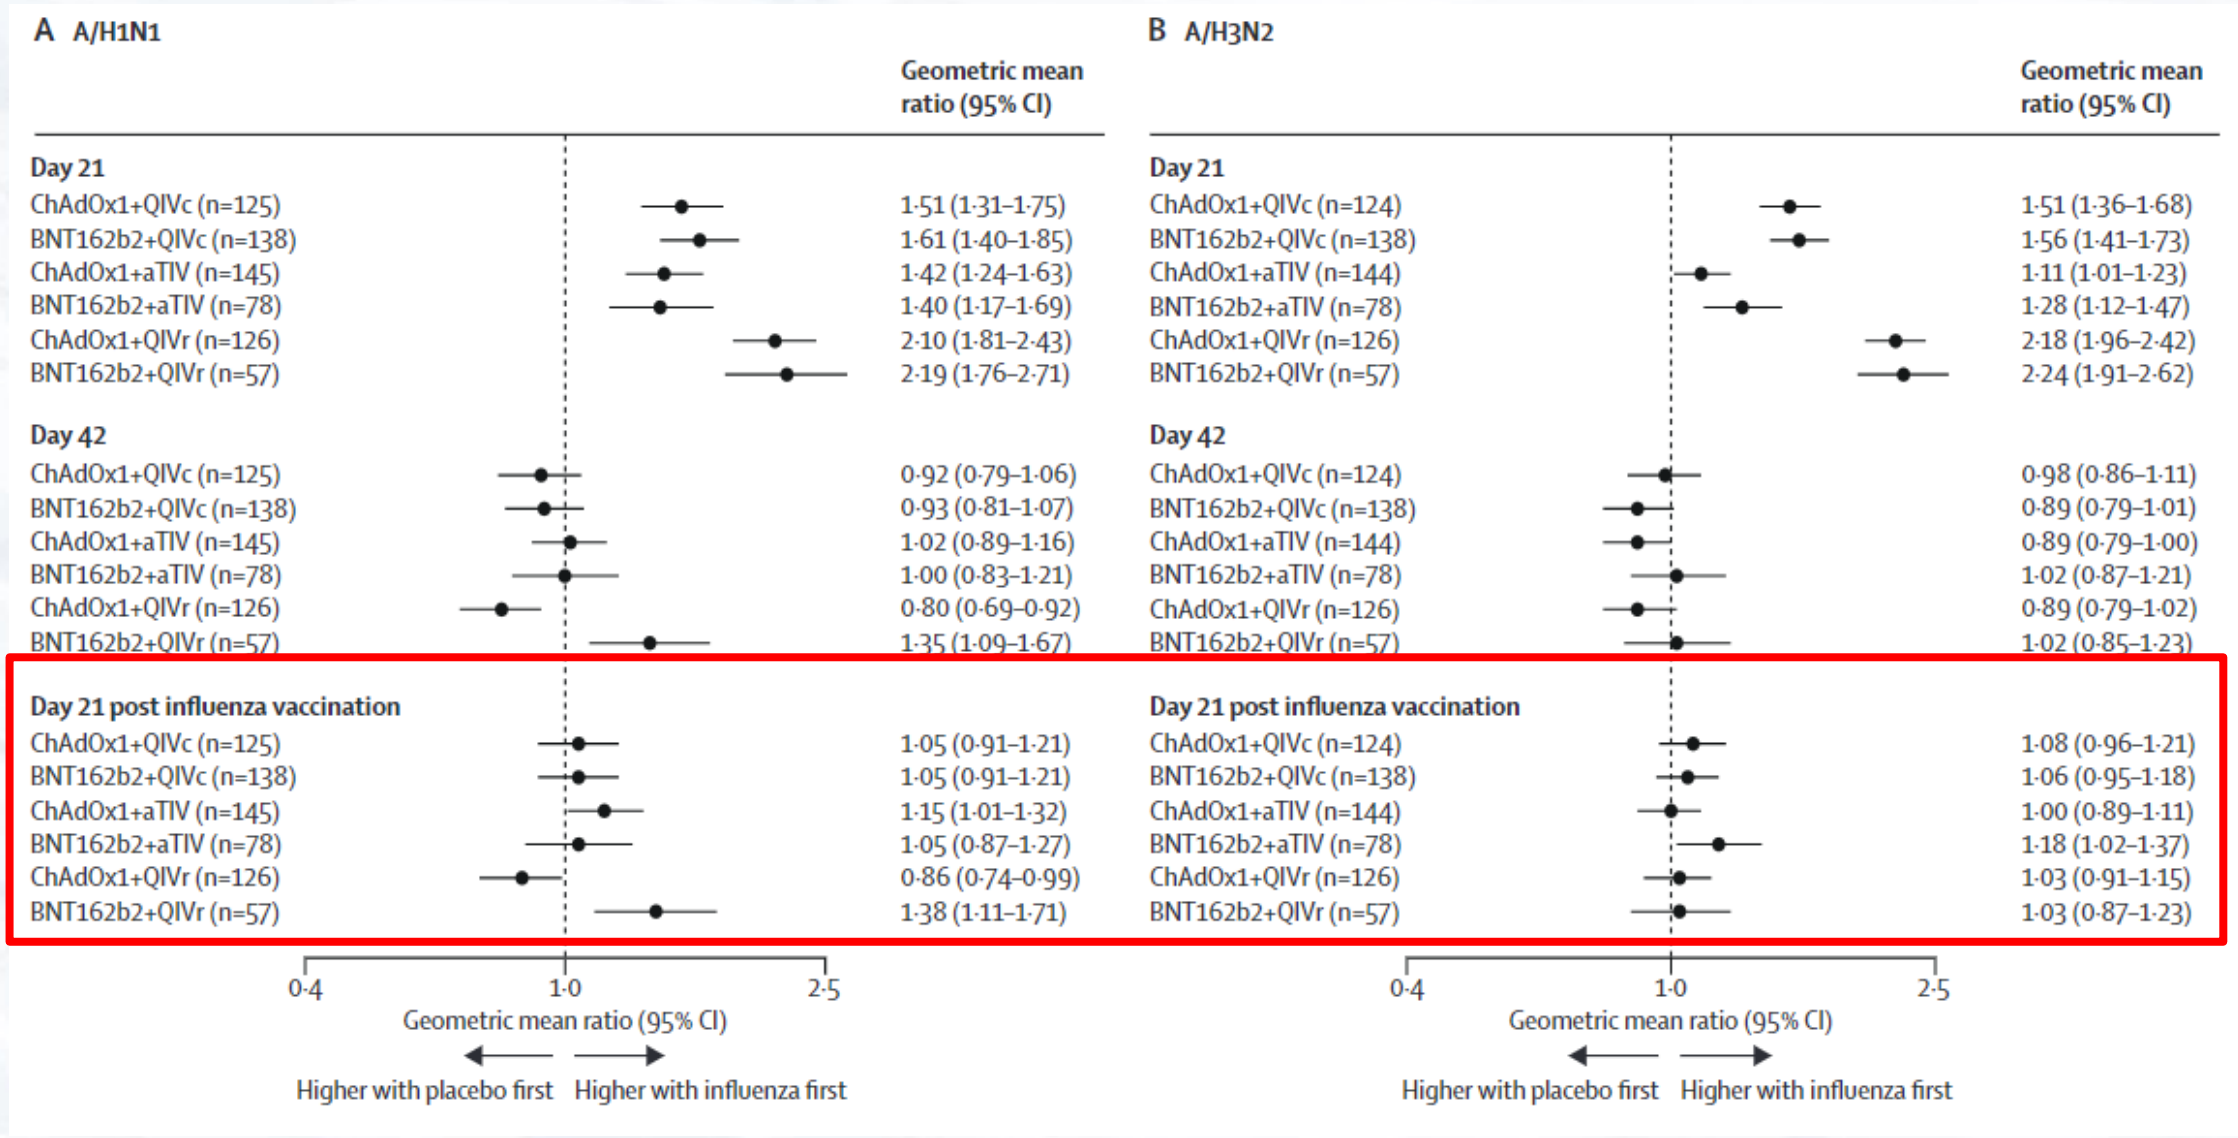
	Number of participants experiencing one or more solicited systemic events in the 7 days after second COVID-19 vaccination/ number of participants with the primary outcome in each group for each cohort		Risk difference (95% CI)
	Placebo first	Influenza first	
ChAdOx1+QIVc ITT	52/63	52/64	−1·29 (−14·69 to 12·11)
BNT162b2+QIVc ITT	54/67	59/68	6·17 (−6·27 to 18·61)
ChAdOx1+aTIV ITT	42/68	49/68	10·29 (−5·44 to 26·03)
BNT162b2+aTIV ITT	25/35	24/41	−12·89 (−34·15 to 8·37)
ChAdOx1+QIVr ITT	43/60	46/62	2·53 (−13·25 to 18·31)
BNT162b2+QIVr ITT	23/28	24/27	6·75 (−11·75 to 25·25)



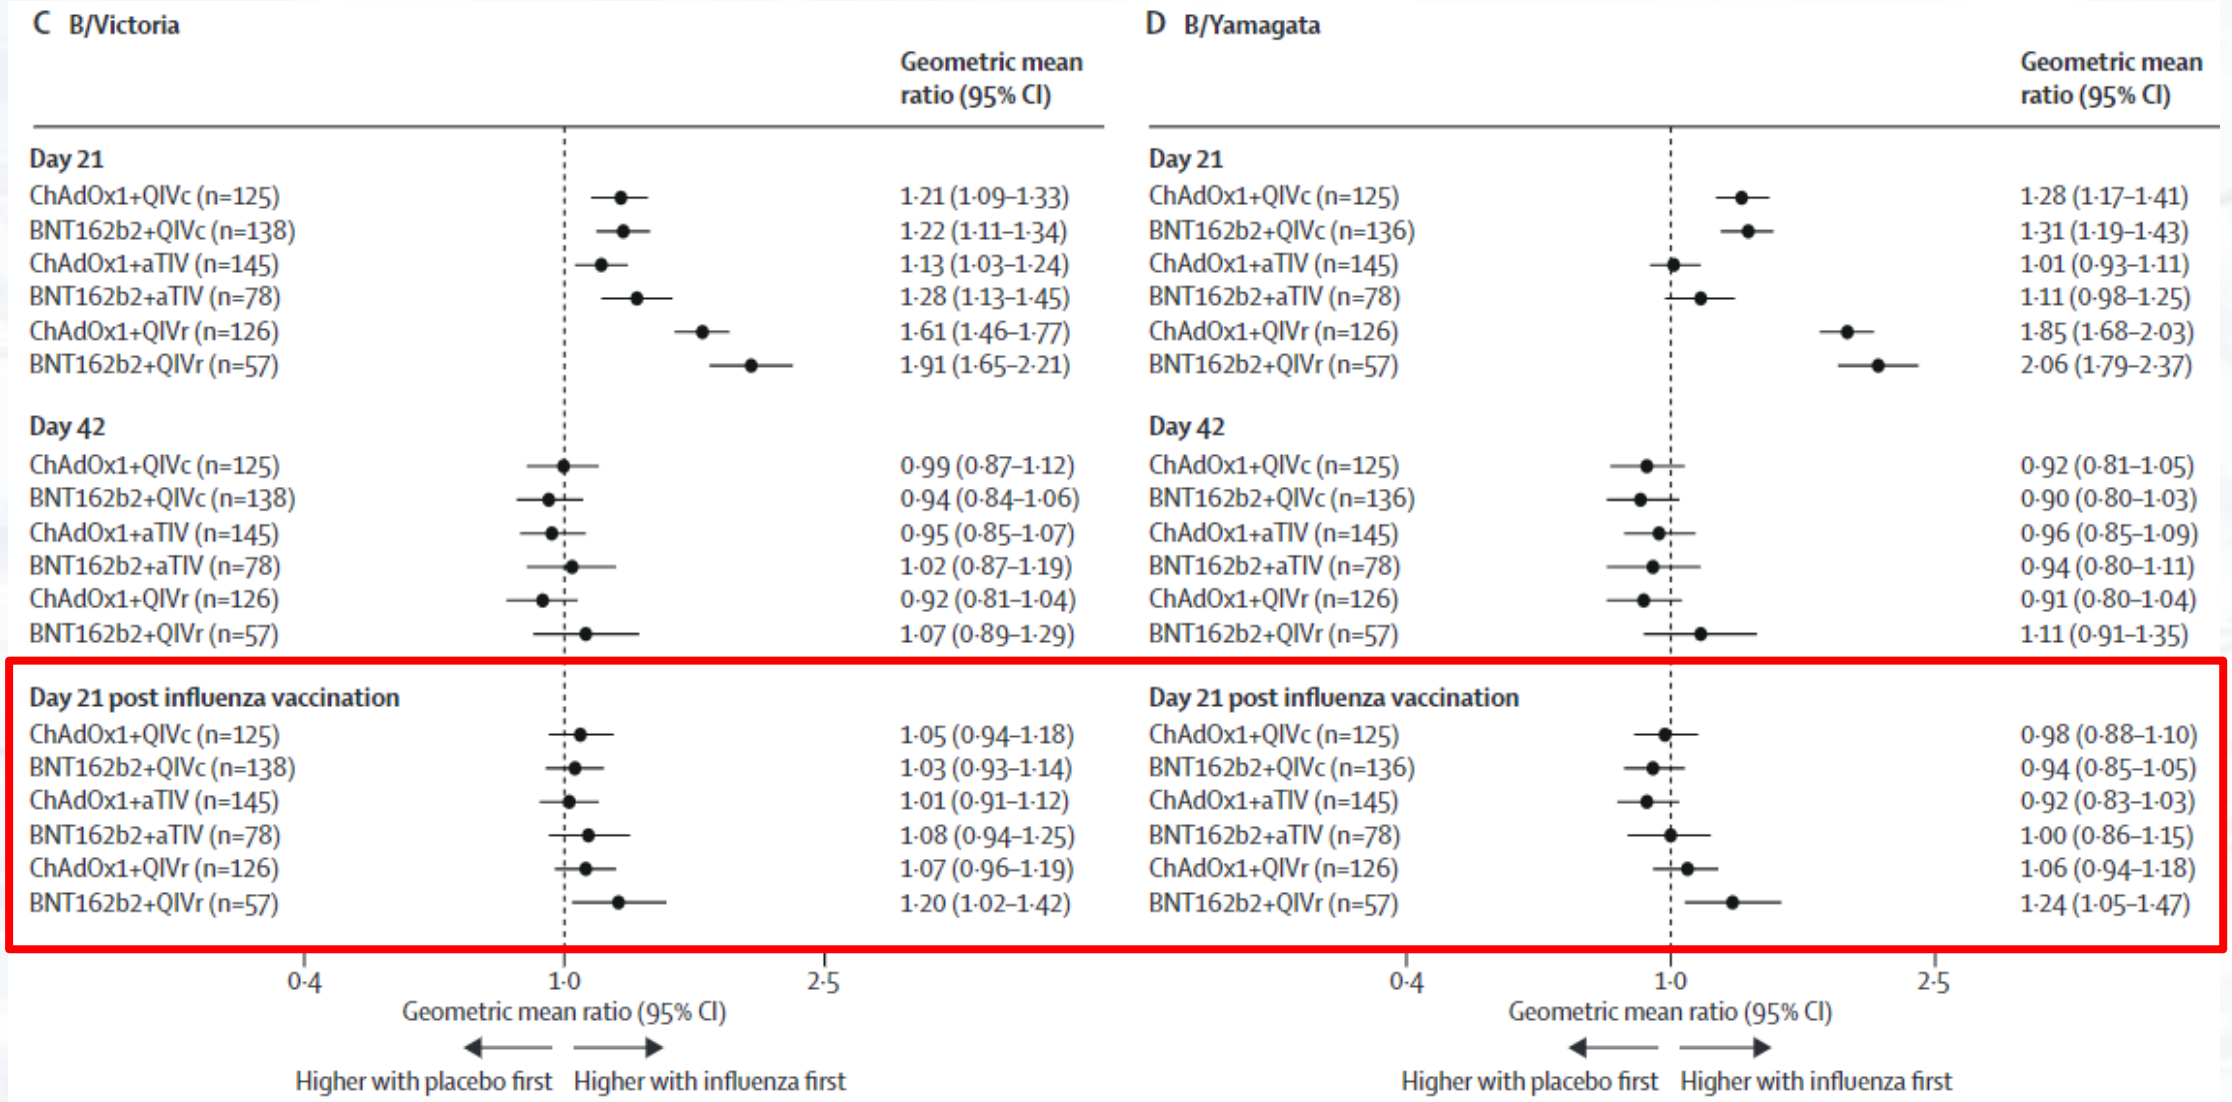
Secondary Outcome-
Anti-spike immunoglobulin (Covid-19)



Secondary Outcome- haemagglutinin antibody inhibition (Influenza)



Secondary Outcome- haemagglutinin antibody inhibition (Influenza)



Conclusion

- Concomitant vaccination with ChAdOx1 or BNT162b2 plus an age-appropriate influenza vaccine raises no safety concerns and preserves antibody responses to both vaccines

limitation

- Not known whether these findings would apply to other vaccines or not
- Influenza vaccine cause more local reactions than placebo
- Two of the cohorts had lower recruitment than planned
- T-cell responses were not evaluated

Factor VIII Inhibitor Bypassing Activity (FEIBA) Reversal for Apixaban and Rivaroxaban in Patients With Acute Intracranial and Nonintracranial Hemorrhage

Annals of Pharmacotherapy 2021, Vol. 55(12) 1455–1466

Inclusion Criteria
• patients 18 to 89 years old • ≥1 FEIBA doses in the hospital ED or inpatient setting • Apixaban or rivaroxaban presumably within 48 hours of FEIBA
Exclusion Criteria
• had a thrombosis history • prisoners, pregnant, outside the age range • received FEIBA for non-FXa inhibitor reversal (hemophilia) • had documented anticoagulant agent beyond 48 hours of presentation • had FEIBA use preoperatively for emergent procedures not specifically indicated for active bleeding reversal

Conclusion

- The combined ICH and non-ICH overall rates of effective hemostasis, TEE, and mortality were comparable to preexisting studies of FEIBA for factor Xa inhibitor reversal.

limitation

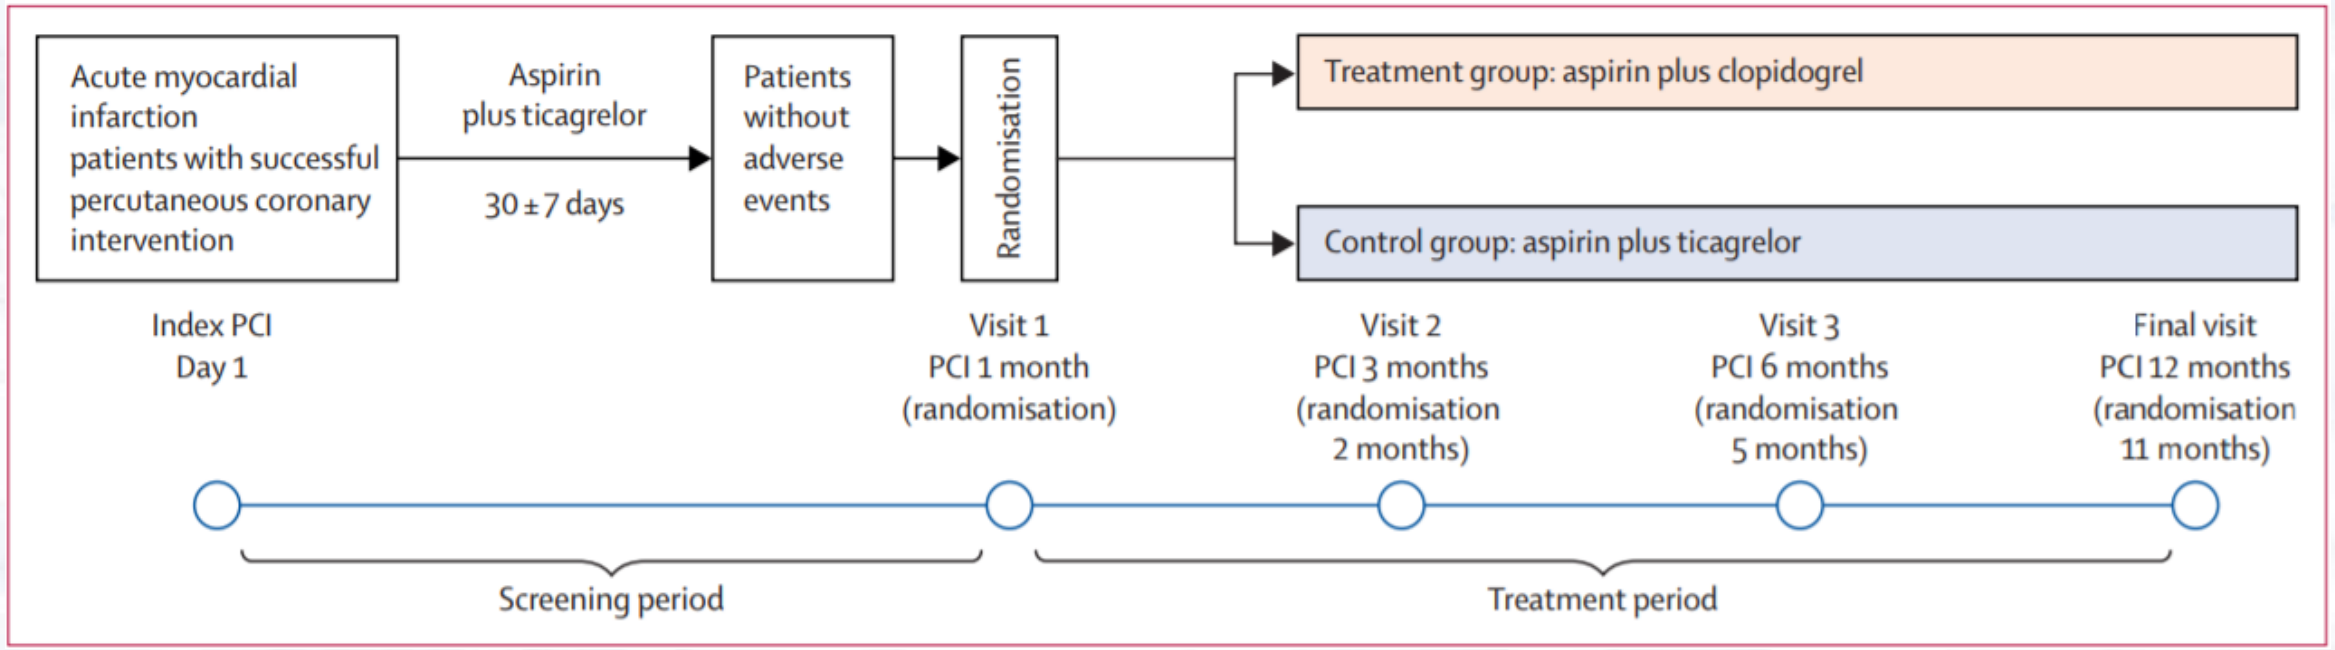
- Retrospective design
- No propensity score matching was performed between apixaban and rivaroxaban users
- No initial National Institutes of Health Stroke Scale (NIHSS) score, initial ICH score, or time from acute bleeding event onset

Unguided de-escalation from ticagrelor to clopidogrel in stabilised patients with acute myocardial infarction undergoing percutaneous coronary intervention (TALOS-AMI): an investigator-initiated, open-label, multicentre, non-inferiority, randomised trial

Lancet 2021; 398: 1305–16

Inclusion Criteria
• Biomarker-positive acute myocardial infarction who underwent successful PCI • Tolerated aspirin and ticagrelor treatment
Exclusion Criteria
• Cardiogenic shock • Active bleeding of any major organs, bleeding diathesis or coagulopathy within 2 months • Intracranial bleeding, intracranial aneurysm, arteriovenous malformation, or neoplasm

Randomised



Treatment group	Control group
Aspirin 100mg QD+ Clopidogrel 75mg QD (n=1349)	Aspirin 100mg QD+ Ticagrelor 90mg BID (n=1348)

Conclusion

- Switching from ticagrelor to clopidogrel reduced the risk of net clinical events up to 12 months, mainly by reducing the bleeding events

limitation

- Open-label
- The non-inferiority margin is wide
- Did not do PFT or genotyping during the study conduct.

Desloratadine Exposure and Incidence of Seizure: A Nordic Post-authorization Safety Study Using a New-User Cohort Study Design, 2001–2015

Drug Safety (2021) 44:1231–1242

Inclusion Criteria
• Denmark, Finland, Norway and Sweden • All individuals with a first-ever dispensing of desloratadine in the study period (2001–2015)
Exclusion Criteria
• Not reside in Denmark, Finland, Norway, or Sweden at the date of first prescription • Seizure, epilepsy, malignant brain tumor, or head trauma, or had redeemed a prescription of antiepileptic medicine before study entry

Baseline characteristics

Conclusion

- The association between desloratadine exposure and incident seizure was seen in all countries, most pronounced in children aged 0–5 years.
- No difference in incidence rate of seizure was observed in adults between desloratadine exposed and unexposed.

limitation

- Lack of information on actual use of the redeemed desloratadine
- Not all drugs that could increase the risk of seizure were taken into account
- Risk of misclassification of the comorbidities included as potential confounders

Abstract
